EuroBloodNet Topic on Focus

# Thrombotic thrombocytopenic purpura

- Rare disease
- Devastating disease
  - Intensive care
  - Lethal when left untreated
  - Life-long
- Types
  - Congenital TTP (5%)  A blue icon representing a DNA double helix.
  - Immune-mediated TTP (95%)  A blue icon representing an antibody molecule with a Y-shape and horizontal bars.

# VWF cleaving protease: ADAMTS13

- Healthy individuals

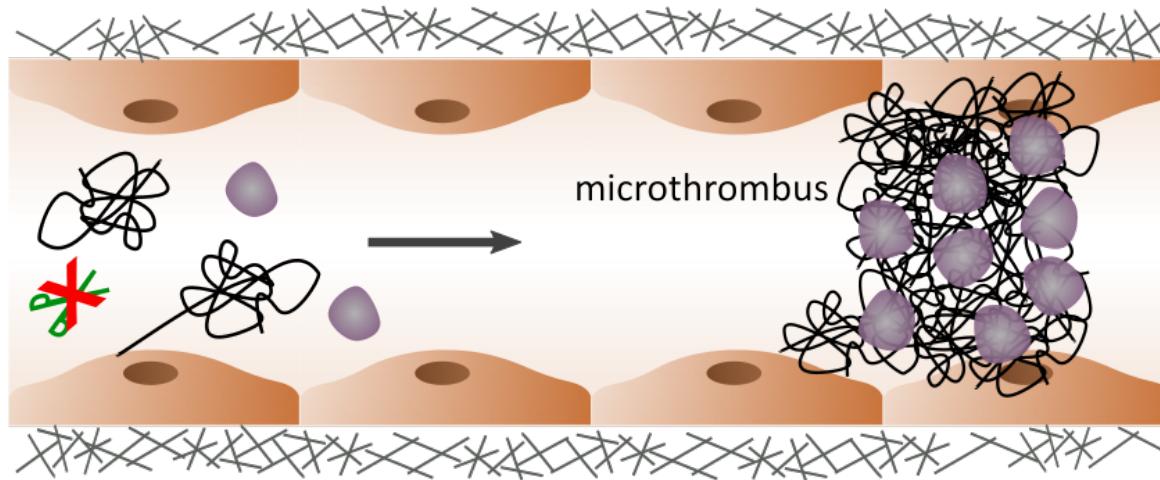

→ VWF cleaving protease ADAMTS13 digests prothrombotic UL-VWF multimers into more quiescent HMW VWF multimers

# VWF cleaving protease: ADAMTS13

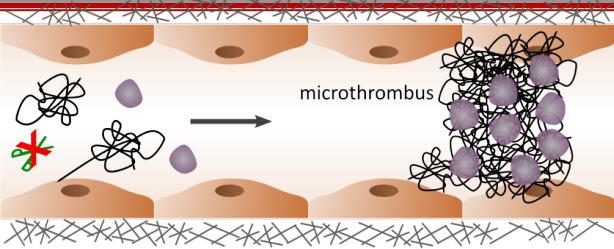

- Thrombotic thrombocytopenic purpura (TTP)

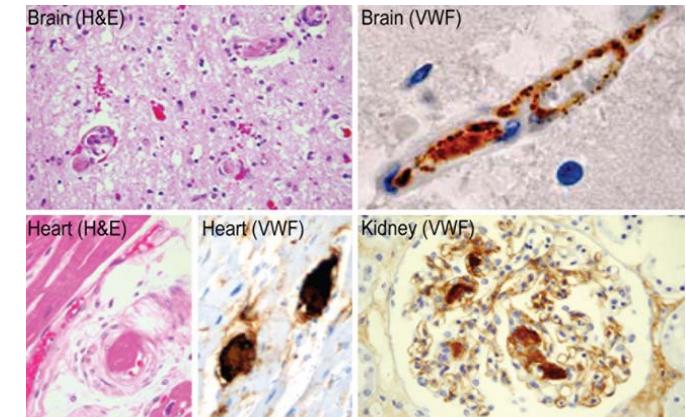

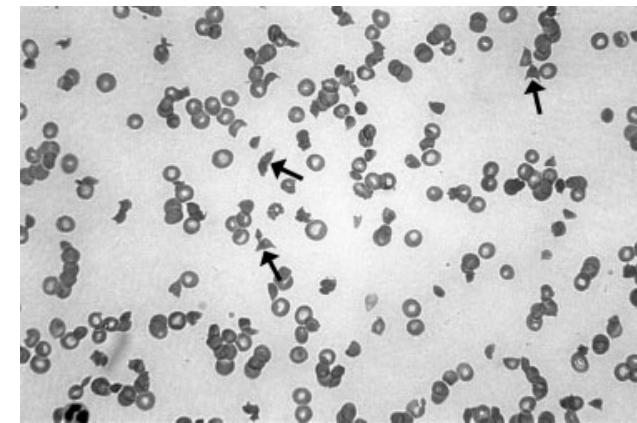

Deficiency in the VWF cleaving protease ADAMTS13 → prothrombotic UL-VWF multimers  
→ microthrombi

# Signs and symptoms

- Severe thrombocytopenia
- Haemolytic anemia
- Disseminated microthrombi
- Organ damage/failure

# Deficient ADAMTS13

- Patients can live for years with ADAMTS13 deficiency: no TTP
- External trigger
  - Pregnancy
  - Stress
  - Surgery
  - Infection
  - ...

# Animal models for TTP

EuroBloodNet Topic on Focus

# Animal models for congenital TTP

- Mouse models

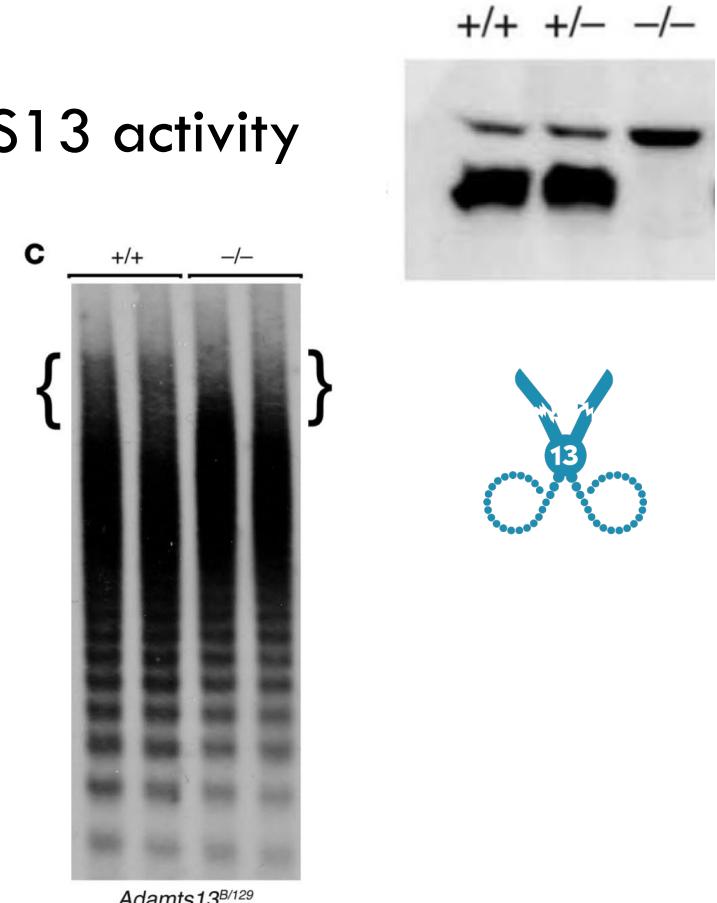

- Zebrafish model

# Animal models for congenital TTP

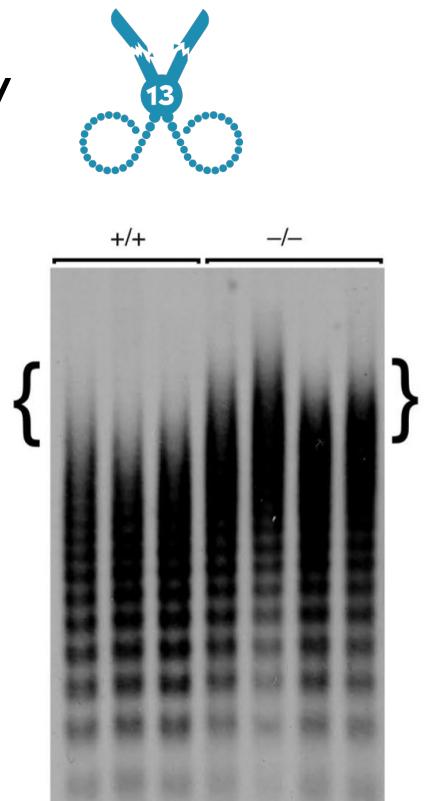

- Mouse models: genetic background: C57BL/6J and 129X1/SvJ ( $Adamts13^{B/129}$ )
  - Disruption of the ADAMTS13 gene (exon 1-6) → no ADAMTS13 activity
  - UL-VWF multimers: no difference between +/+ and -/-
  - Normal development and survival
  - No spontaneous TTP signs and symptoms!
    - Pregnancy did not trigger TTP

# Animal models for congenital TTP

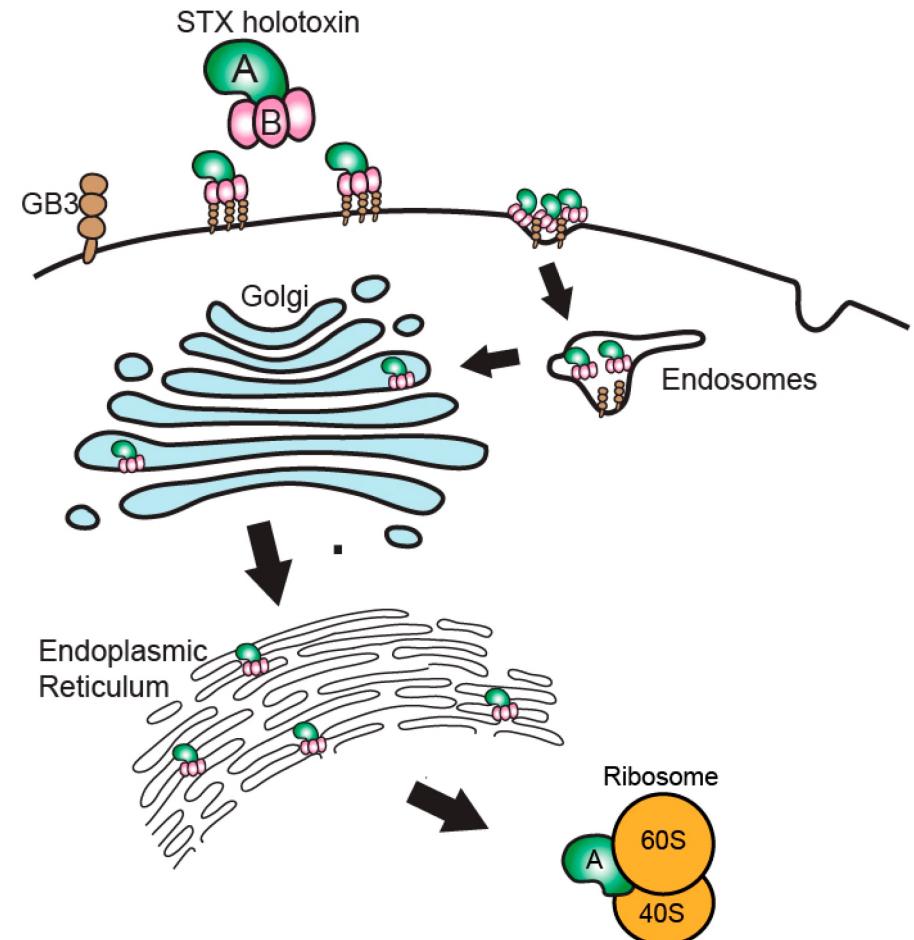

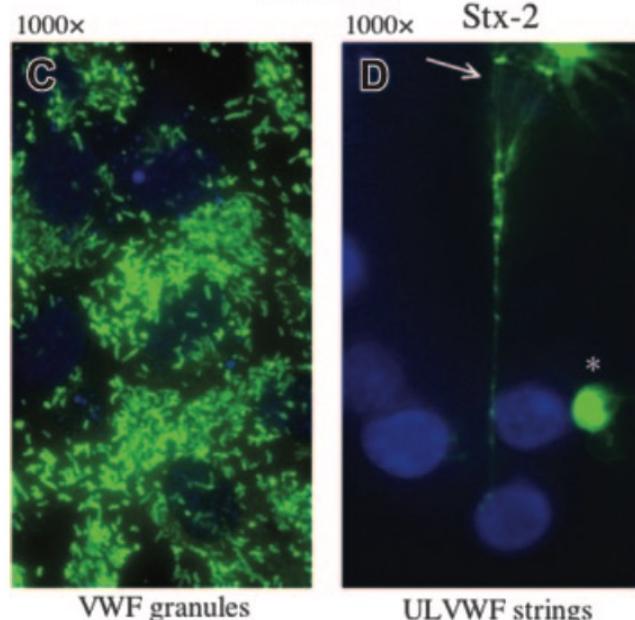

- Mouse models: genetic background back crossed on CASA/Rk (*Adamts13<sup>B/CN2-/-</sup>*)
  - 5- to 10-fold increase in VWF levels
  - Disruption of the ADAMTS13 gene (exon 1-6) → no ADAMTS13 activity
  - UL-VWF multimers: difference between +/+ and -/-
- Normal development and survival
  - Pregnancy not a trigger for TTP
- Sporadic mice with spontaneous TTP signs and symptoms

# Animal models for congenital TTP

- Mouse models: trigger needed to induce TTP
  - Shigatoxin (STX) to trigger TTP?
  - STX B subunit activates endothelial cells
- release of UL-VWF

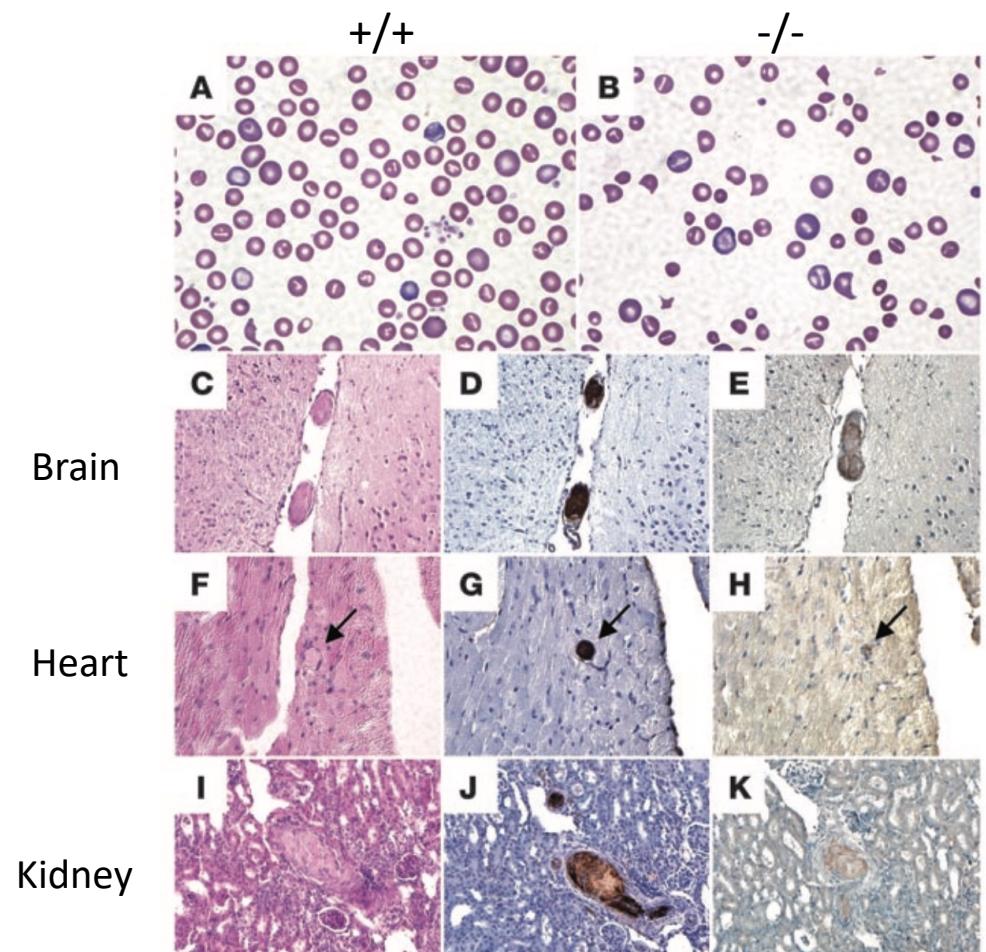

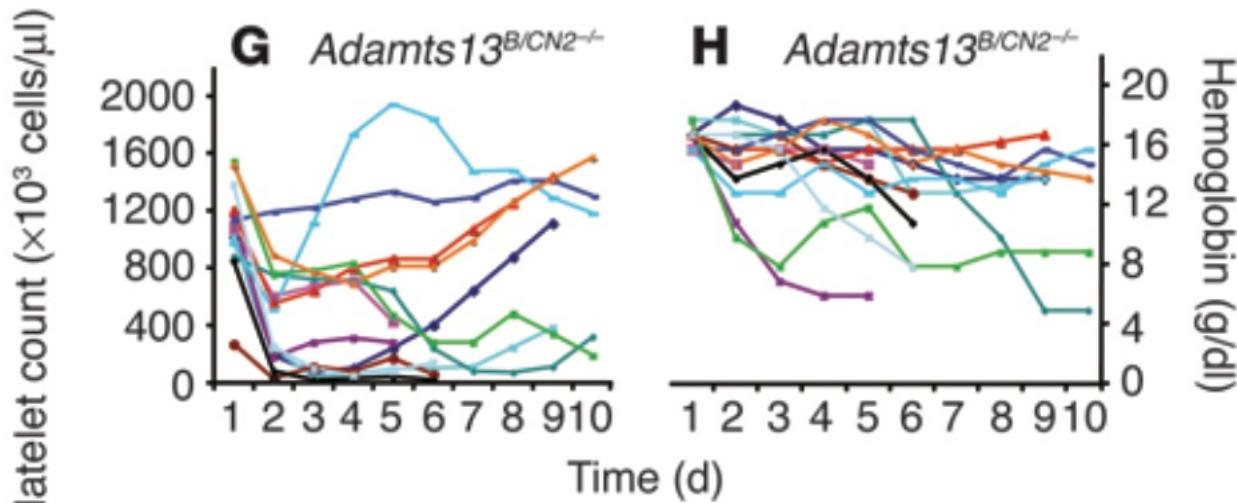

# Animal models for congenital TTP

- Shigatoxin as a trigger for TTP:

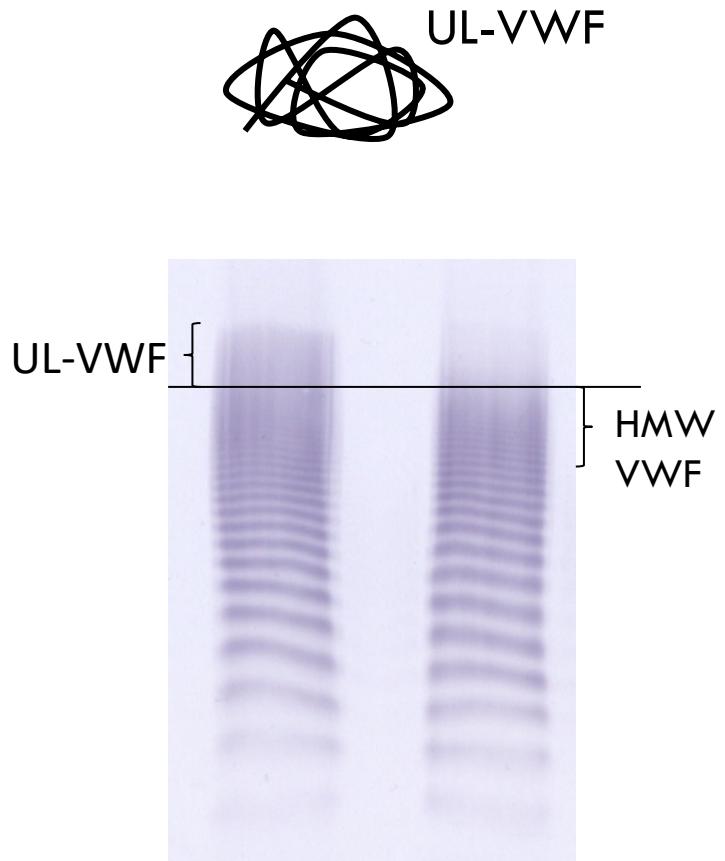

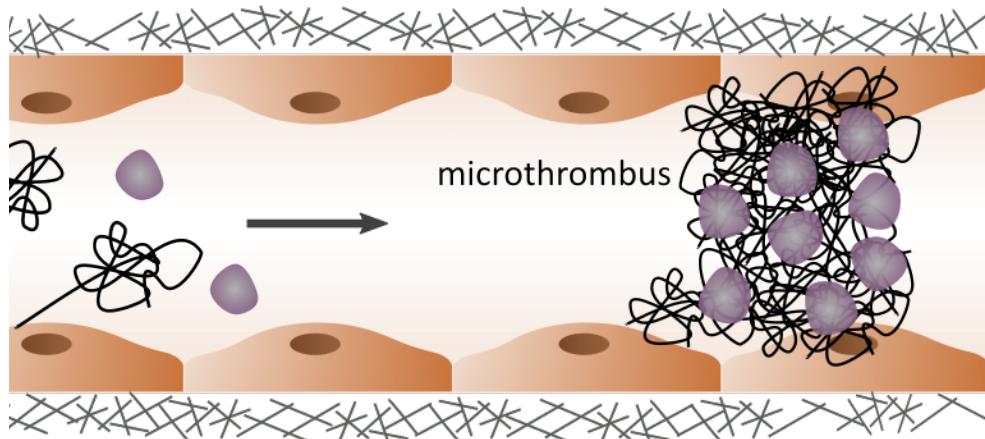

- Injection of Shigatoxin in *Adamts13<sup>B/129</sup>-/-*: no TTP
- Injection of Shigatoxin in *Adamts13<sup>B/CN2</sup>-/-*: TTP but not in all animals
  - Severe thrombocytopenia (5/13)
  - Hemolytic anemia
  - Few microthrombi

# Animal models for congenital TTP

- rVWF as a trigger for TTP:

# Animal models for congenital TTP

- rVWF as a trigger for TTP:

- Injection of rVWF in *Adamts13<sup>B/129-/-</sup>* :TTP

- rVWF contains UL-VWF multimers

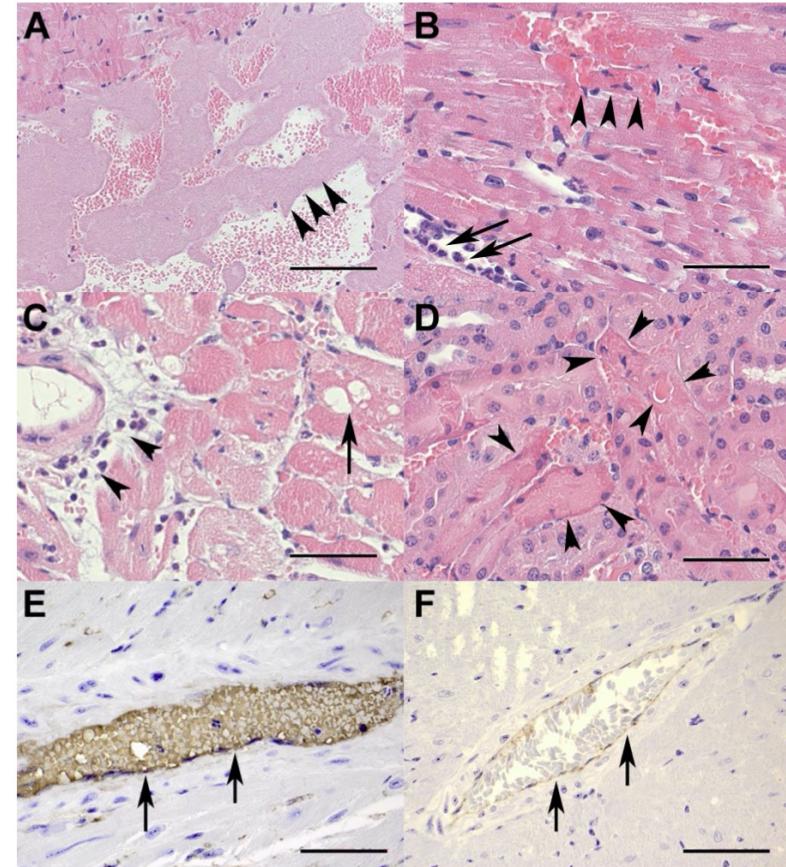

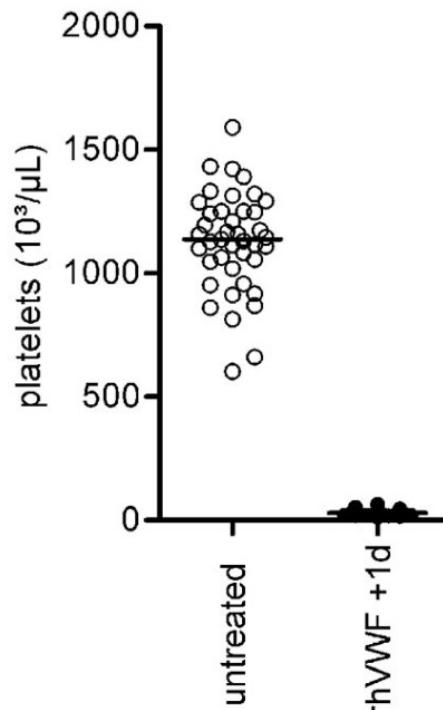

- Severe thrombocytopenia (all mice)

- Hemolytic anemia

- Decreased hematocrit
    - schistocytes

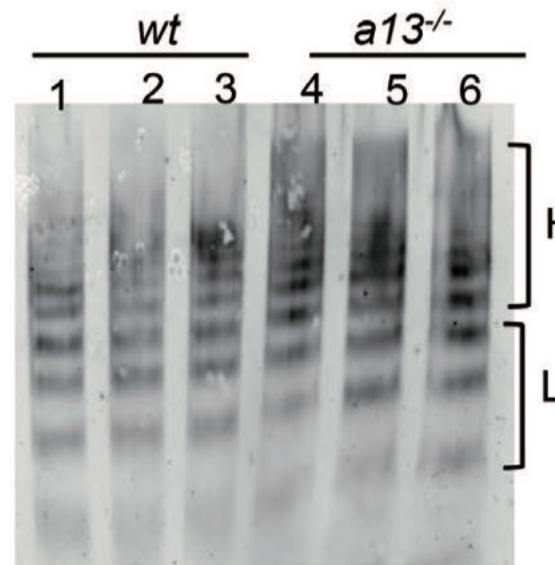

- Organ damage

- Macroscopic lesions in the heart
    - Platelet-VWF aggregates
    - Increased LDH

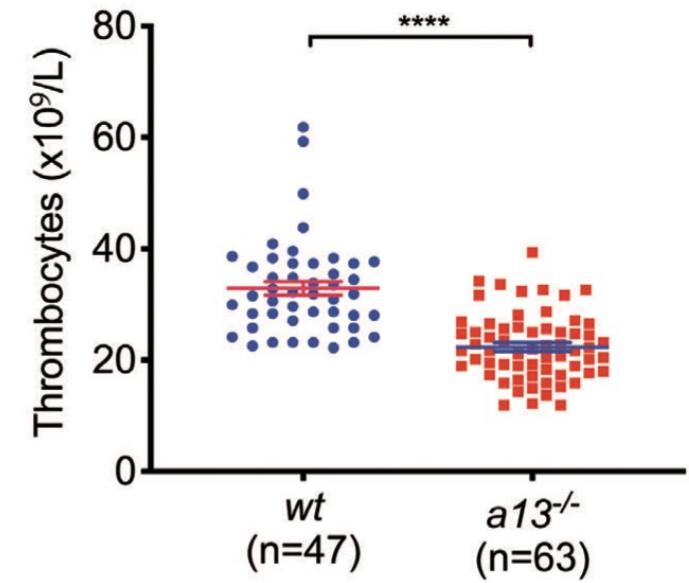

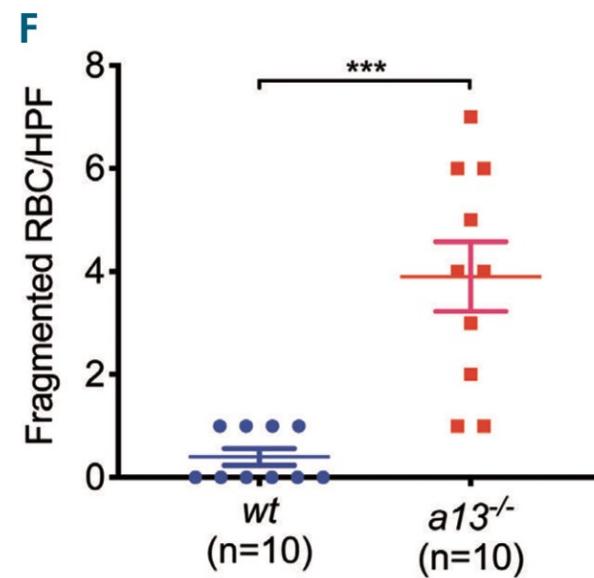

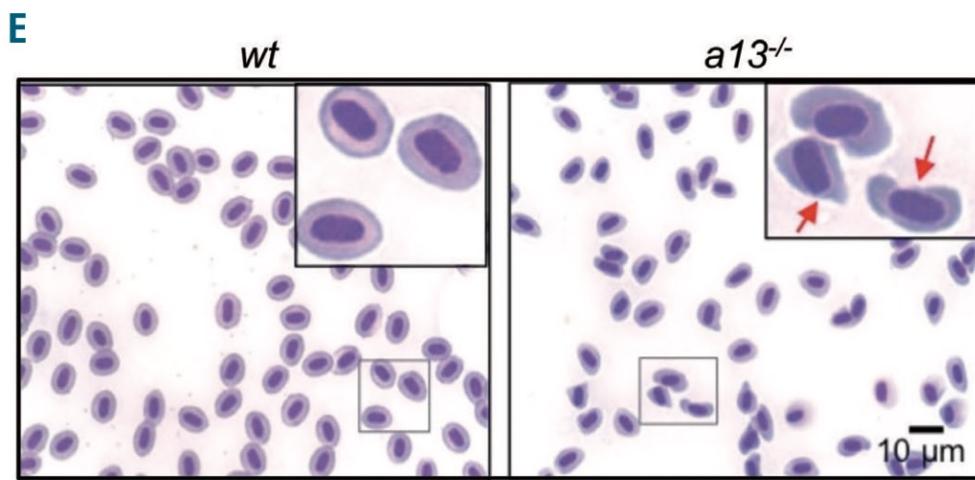

- Zebrafish model
  - Disruption of the ADAMTS13 gene (CRISPR/Cas9, 8 nt deletion is signal peptide) → no expression of the ADAMTS13 protein (WB), no ADAMTS13 activity
  - UL-VWF multimers: difference between +/+ and -/-

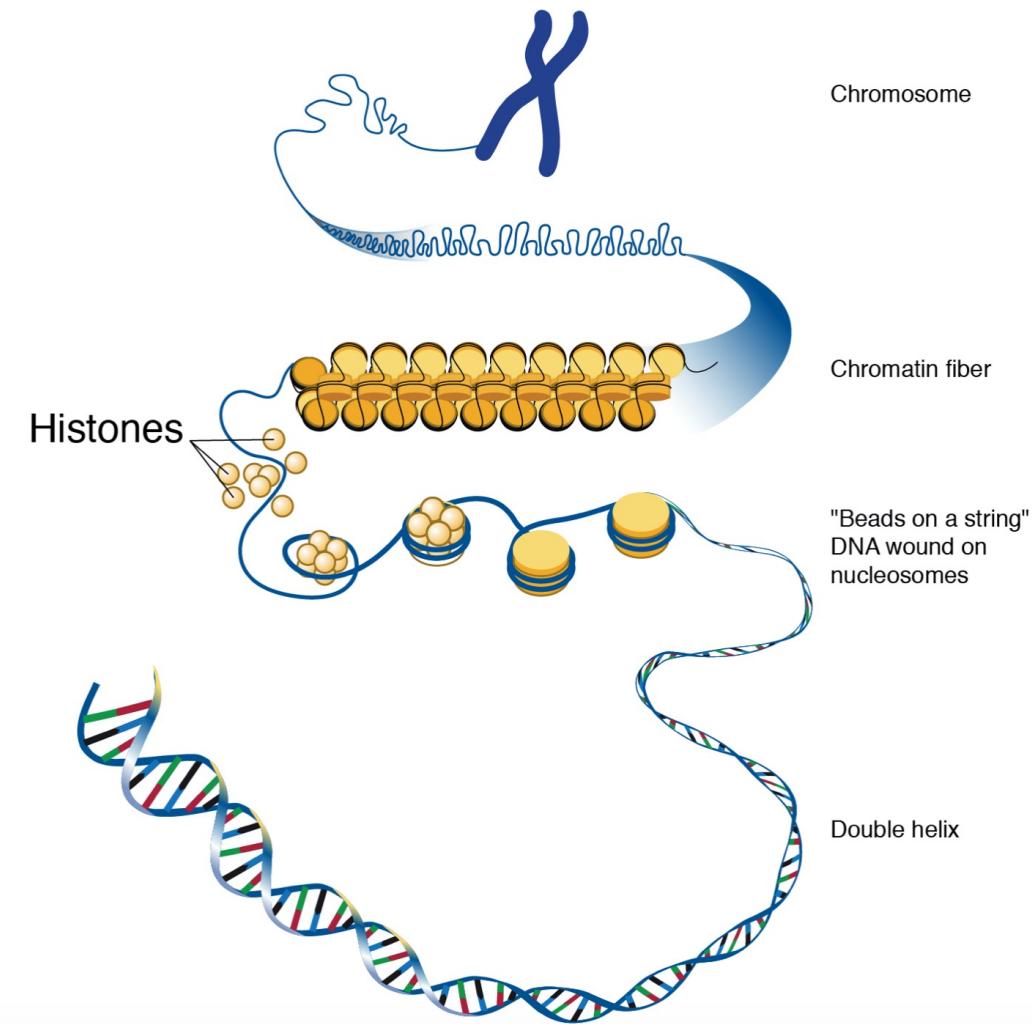

- No spontaneous TTP
  - Mild thrombocytopenia
  - Mild hemolytic anemia

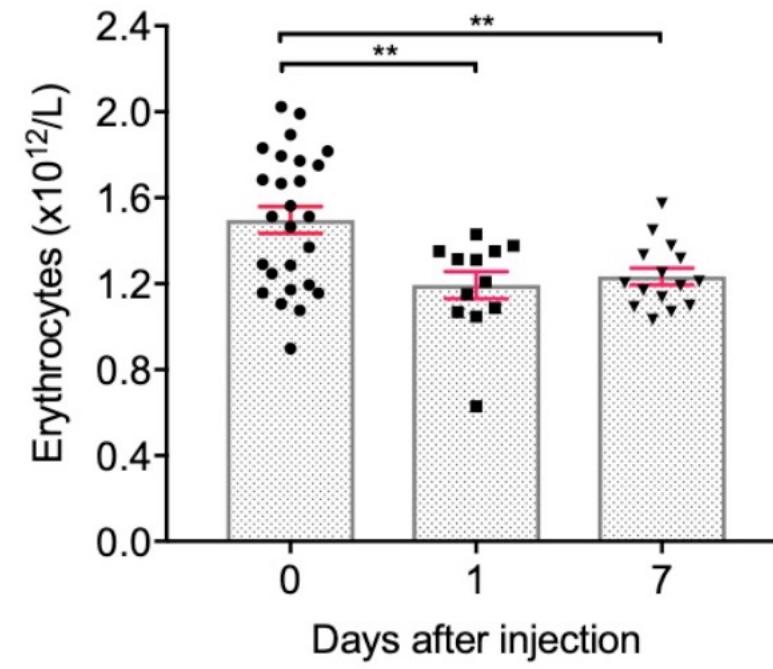

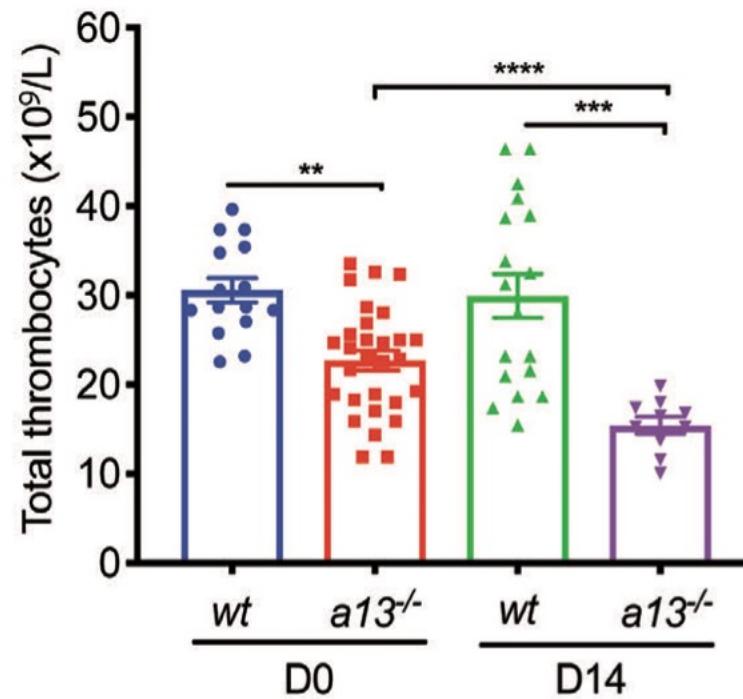

- Lysine-rich histones as a trigger for TTP

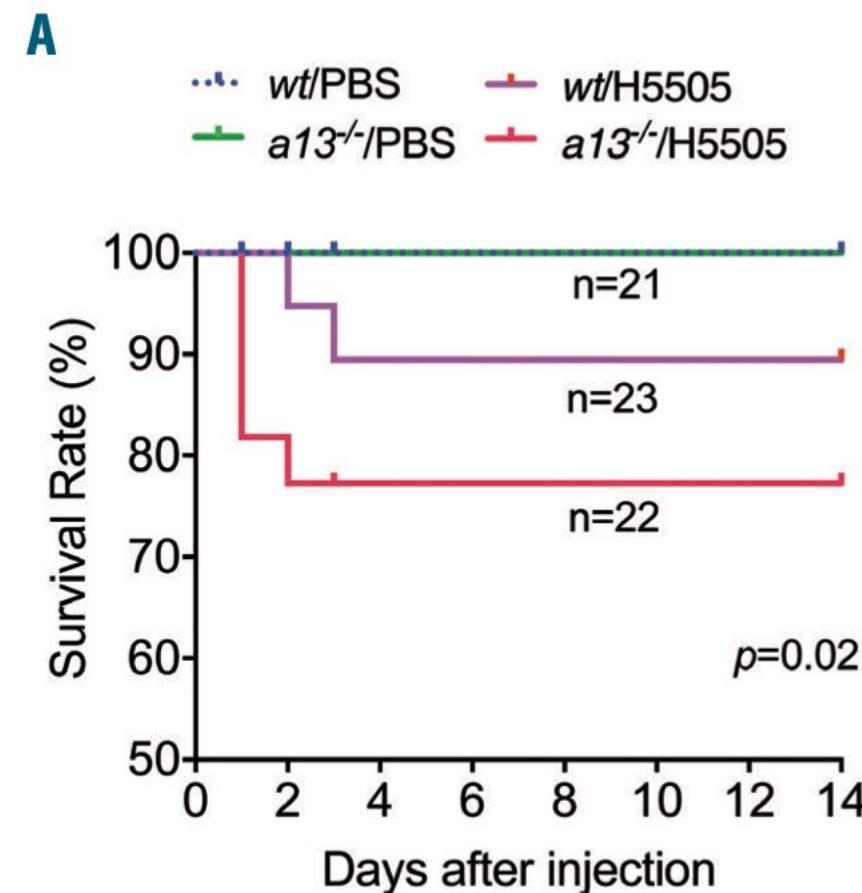

- Lysine-rich histones as a trigger for TTP
  - Significant Thrombocytopenia
  - Mild hemolytic anemia

- Lysine-rich histones as a trigger for TTP

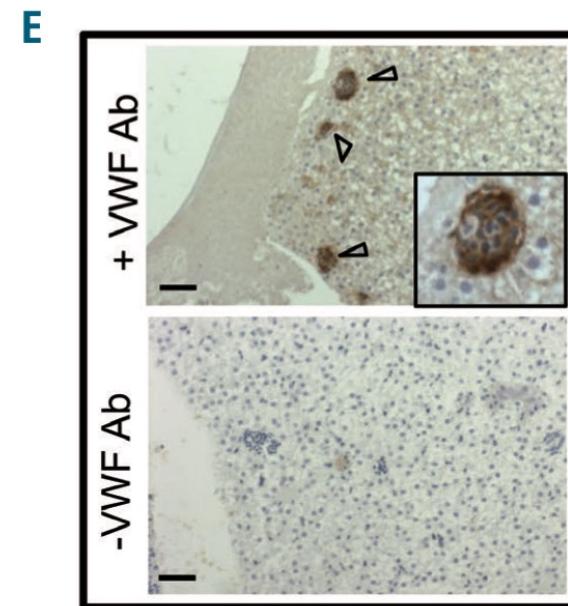

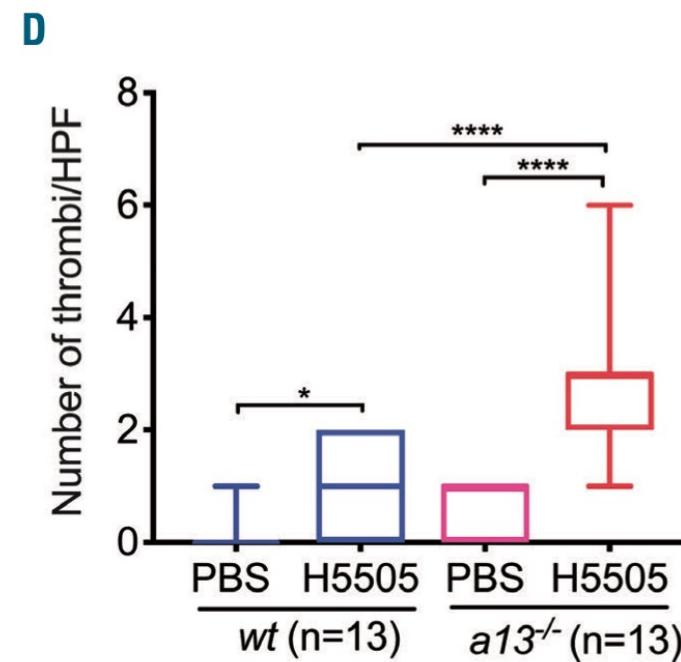

- Decreased survival of *Adamt1* 3<sup>-/-</sup> zebrafish challenged with Lysine-rich histones (H5505)

- Lysine-rich histones as a trigger for TTP

- Multiple large microvascular thrombi in liver and mesenteric vessels in *Adamt13*<sup>-/-</sup> zebrafish challenged with H5505

# Animal models for congenital TTP: Conclusion

- Mouse and zebrafish models:
- ADAMTS13 deficiency not lethal and well tolerated
  - Humans: cTTP patients can remain free of TTP until early adulthood
- Signs and symptoms: to various extent
  - Thrombocytopenia, hemolytic anemia, microthrombi (organ damage, LDH)
- Triggers: Shigatoxin, rVWF, Lysine-rich histones
  - Stimulation of UL-VWF release
  - Other genetic factors: variations in platelet or vessel wall function?
  - Humans: pregnancy, stress, infection, surgery, ...

# Animal models for immune-mediated TTP

EuroBloodNet Topic on Focus

# Animal models for Immune-mediated TTP

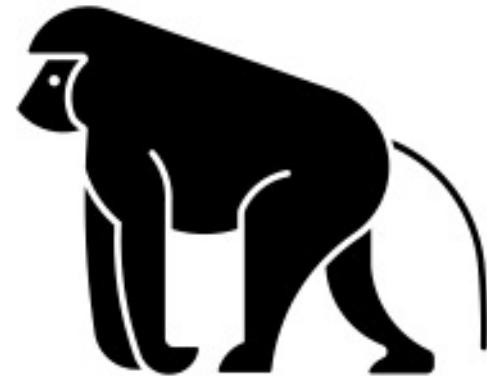

- Mouse models

- Rat model

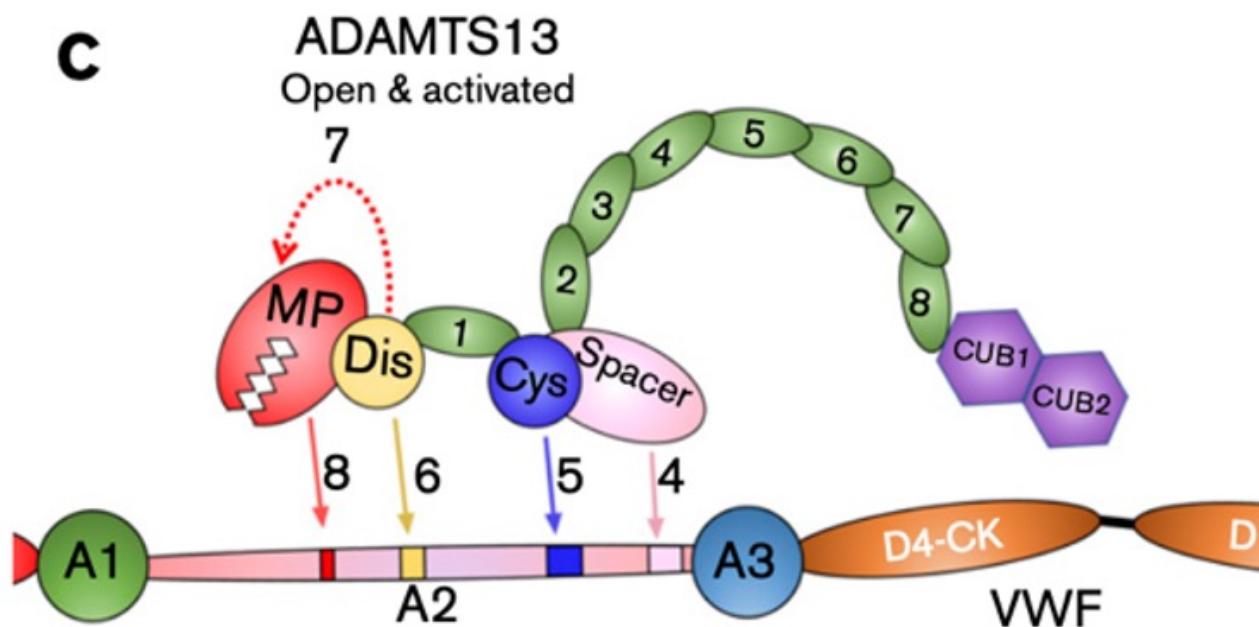

- baboon model

# Animal models for Immune-mediated TTP

- Mouse models: WT mice
  - Injection of murine inhibiting anti-ADAMTS13 antibodies
  - Injection of human inhibiting anti-ADAMTS13 autoantibody

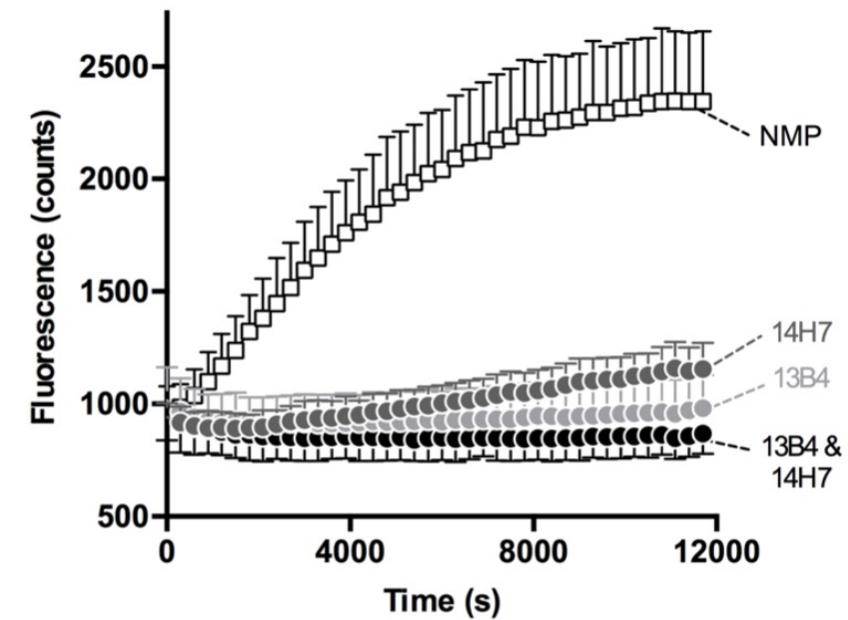

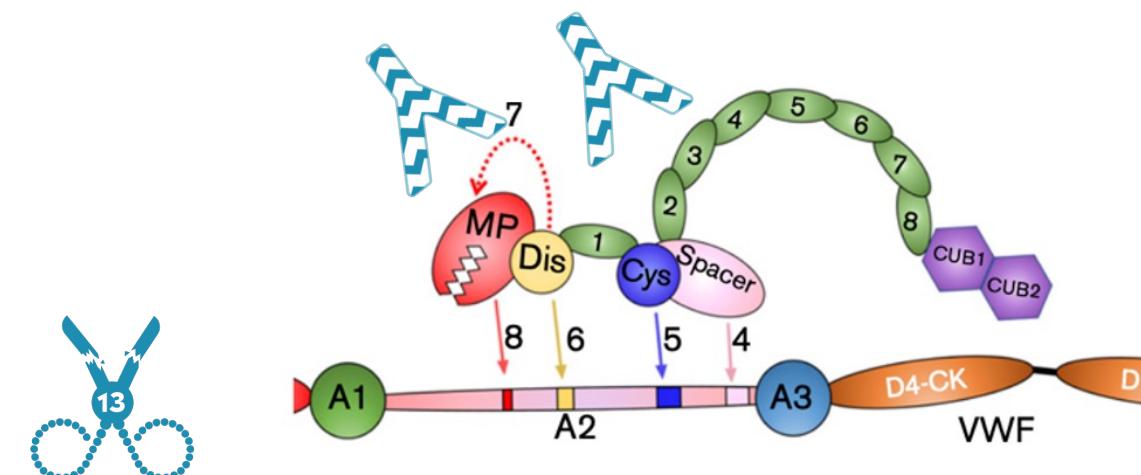

# Animal models for Immune-mediated TTP

- Mouse models: WT mice

- Injection of murine inhibiting anti-ADAMTS13 antibodies

- Anti-MDTCS: 13B4 & 14H7
- No ADAMTS13 activity

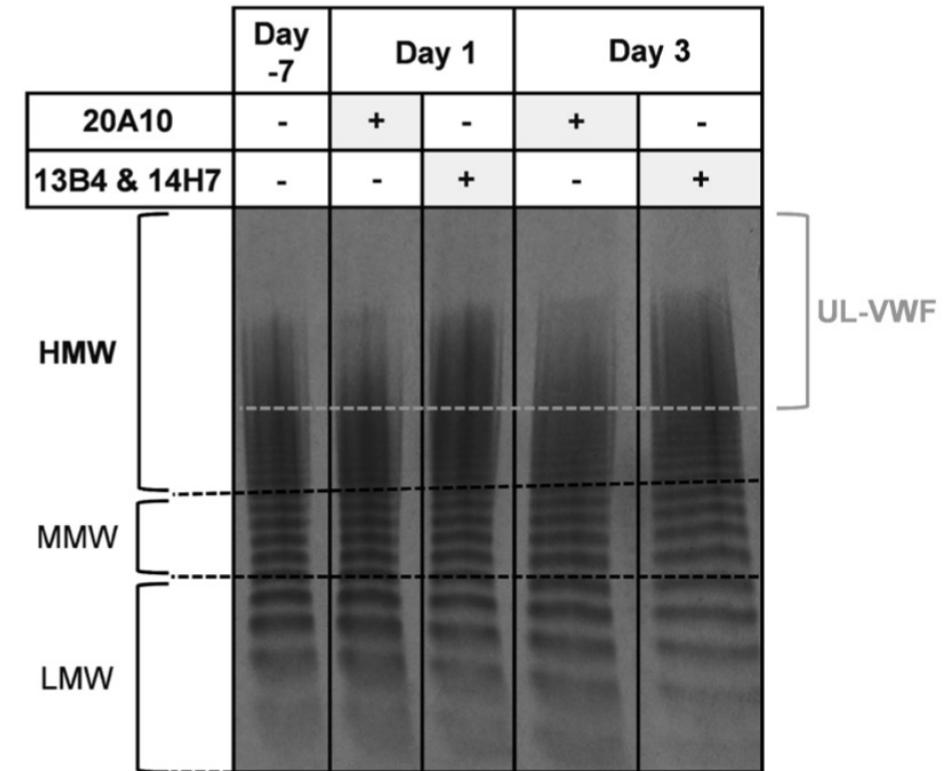

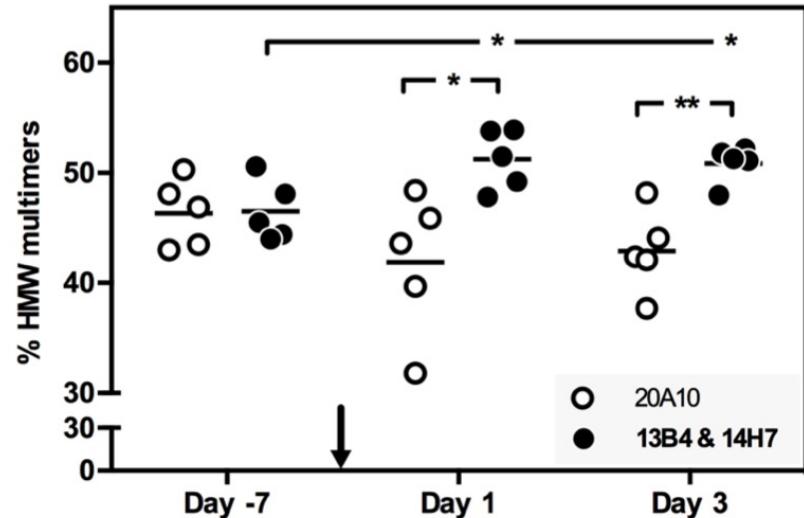

# Animal models for Immune-mediated TTP

- Mouse models: WT mice

- Injection of murine inhibiting anti-ADAMTS13 antibodies

- UL-VWF

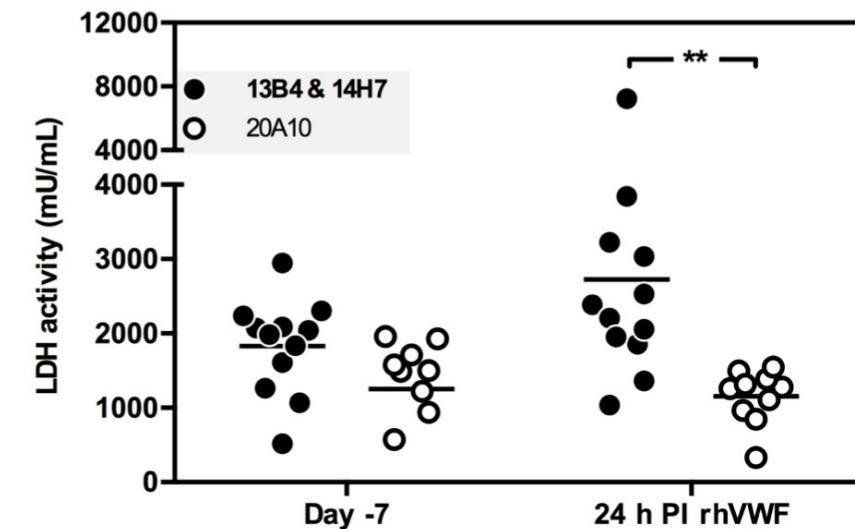

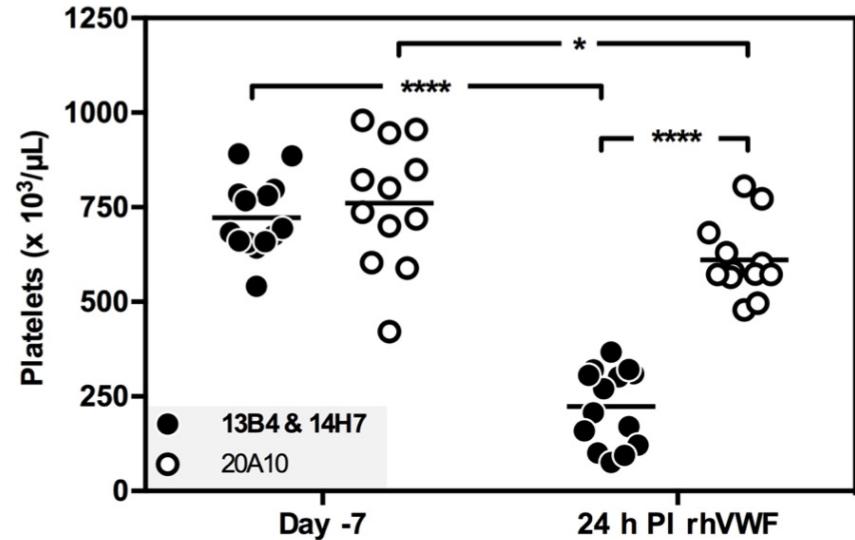

- No spontaneous TTP: no thrombocytopenia, no increase in LDH

# Animal models for Immune-mediated TTP

- rVWF as a trigger for TTP:
  - Injection of rVWF
    - rVWF contains UL-VWF multimers
  - Severe thrombocytopenia (all mice)
  - Organ damage
    - Few microthrombi
    - Increased LDH

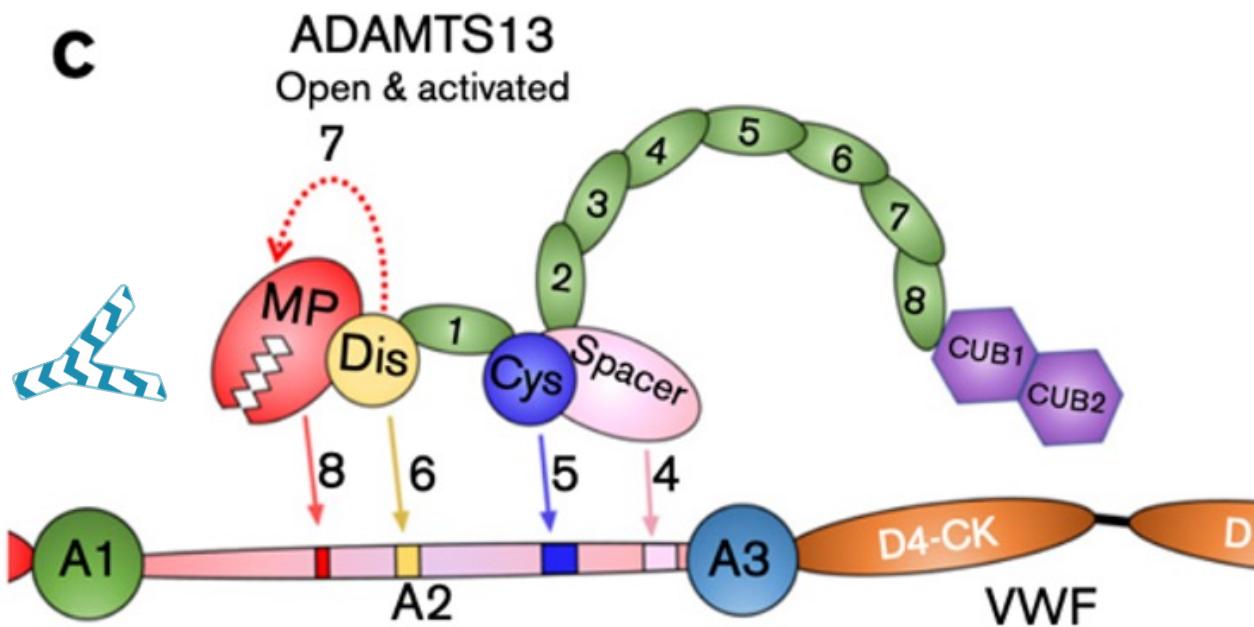

# Animal models for Immune-mediated TTP

- Baboon model: WT baboon

- Injection of murine inhibiting anti-ADAMTS13 antibody

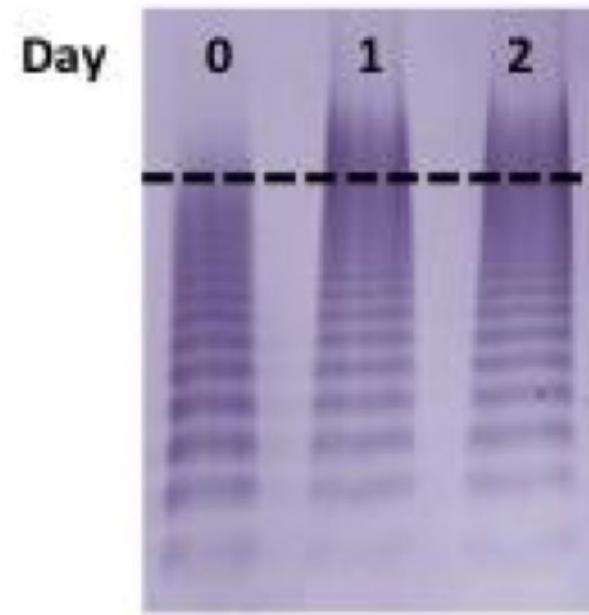

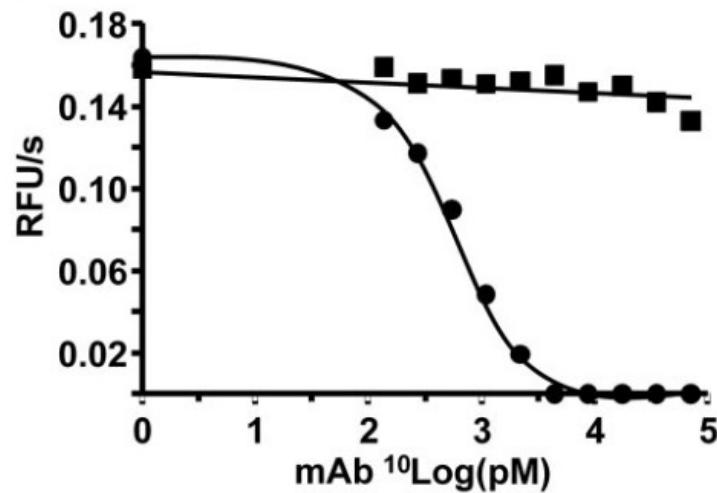

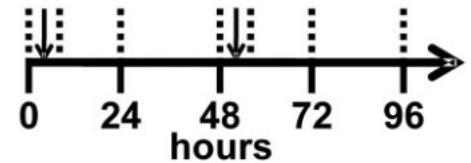

# Animal models for Immune-mediated TTP

- Baboon model: WT baboon

- Injection of murine inhibiting anti-ADAMTS13 antibody

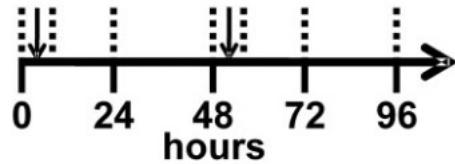

- Inhibition of baboon ADAMTS13 activity
- Appearance of UL-VWF

# Animal models for Immune-mediated TTP

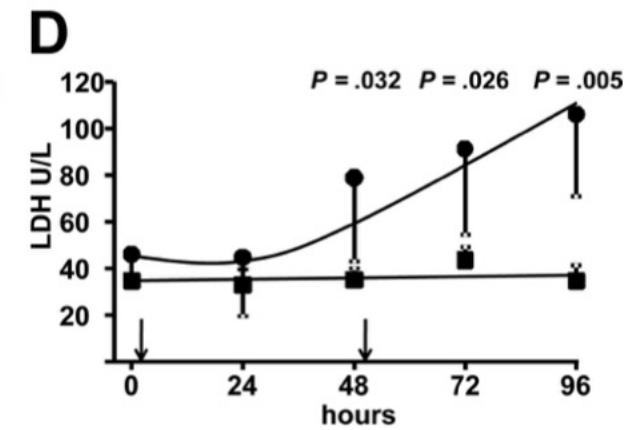

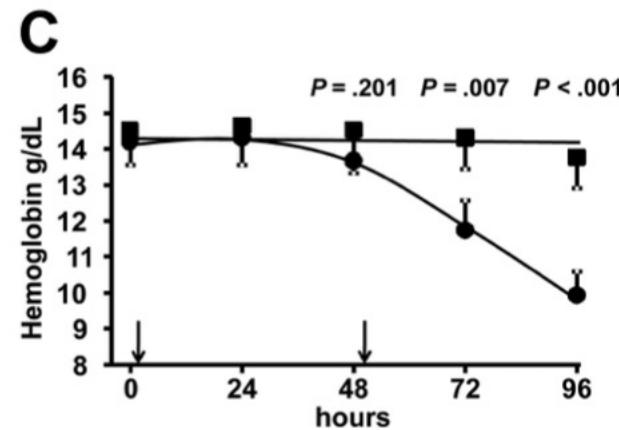

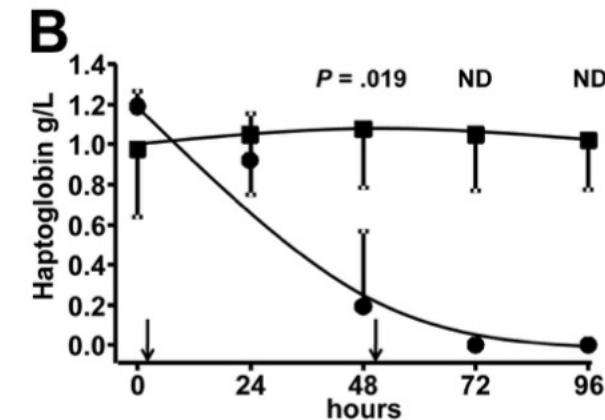

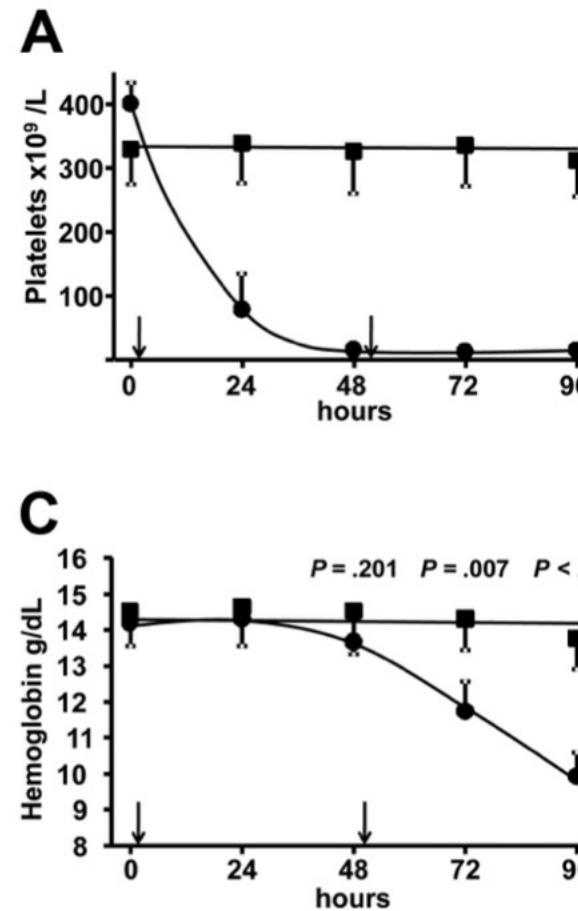

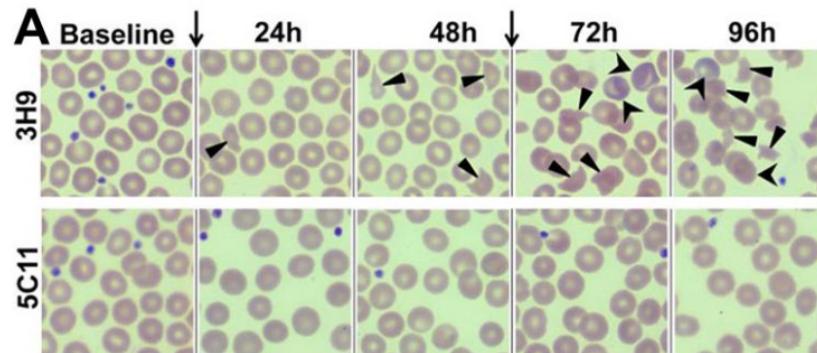

- Baboon model: WT baboon

- Spontaneous TTP in all baboons

- Severe thrombocytopenia
- Hemolytic anemia
- Increase in LDH

# Animal models for Immune-mediated TTP

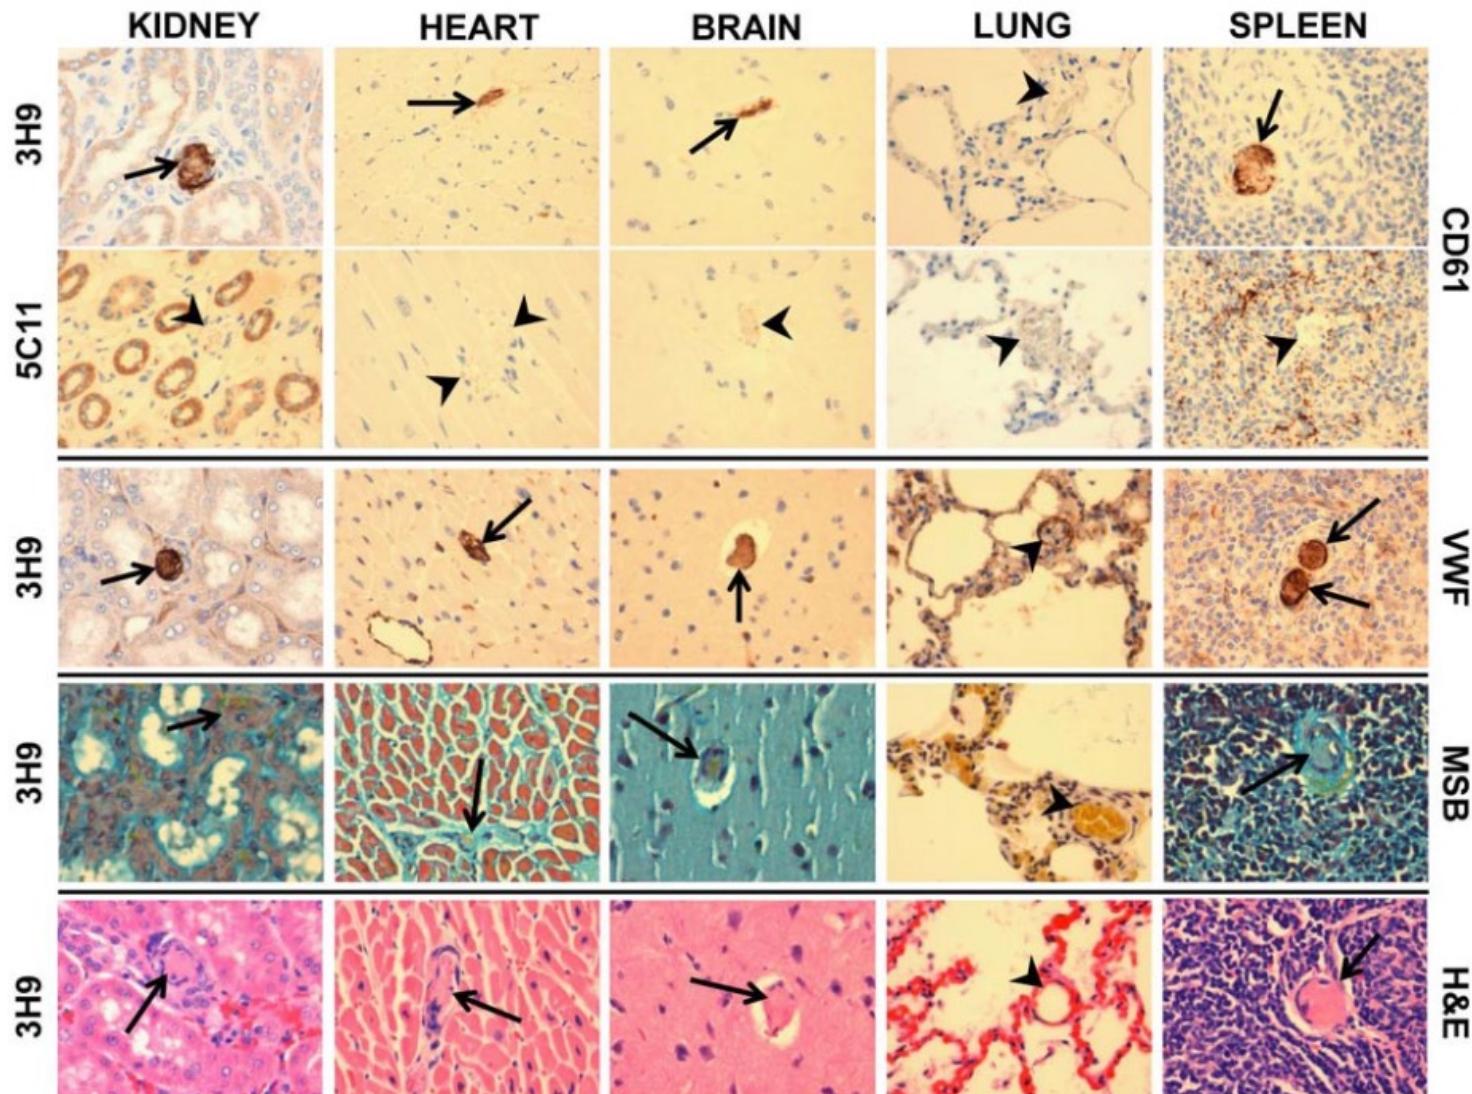

- Baboon model: WT baboon

— Spontaneous TTP in all baboon

- Microthrombi

→ Early stages of TTP

# Animal models for immune-mediated TTP: Conclusion

- Mouse, rat and baboon models:
- Antibodies to inhibit ADAMTS13
  - Mice: mouse or human anti-MDTCs or anti-S antibodies
  - Rat: polyclonal anti-human antibodies
  - Baboon: mouse anti-M antibody
- Mice and rats: ADAMTS13 deficiency not lethal and well tolerated
- Baboon: ADAMTS13 deficiency leads to early stages of TTP

# Animal models for immune-mediated TTP: Conclusion

- Mice and rats: signs and symptoms: to various extent
    - Thrombocytopenia, hemolytic anemia, microthrombi (organ damage, LDH)
  - Baboons: clear signs and symptoms
- 
- Mice and rats: triggers: Shigatoxin, rVWF
  - Baboons: no trigger for early phase of TTP, trigger for end stage TTP?

# Animal models for TTP: developing novel therapies

# Novel therapies for TTP

- Recombinant ADAMTS13
  - Replace

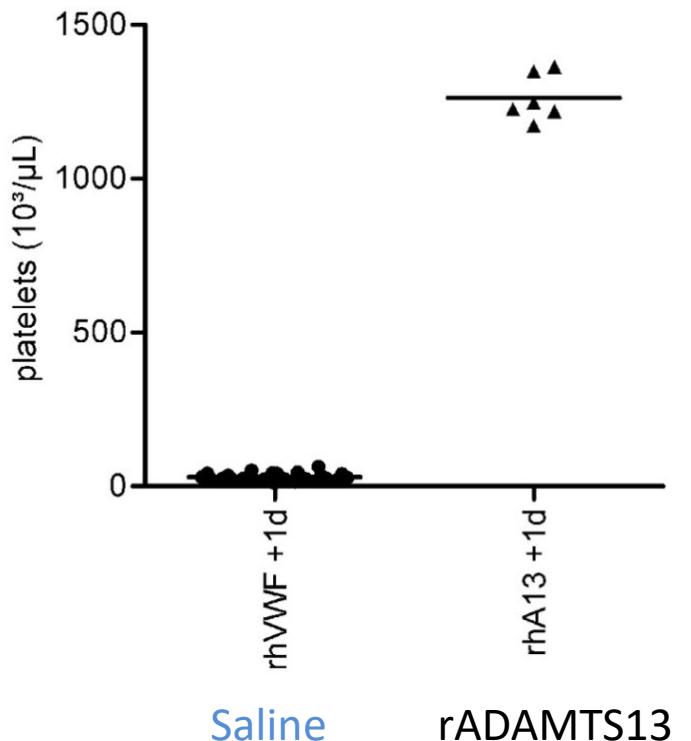

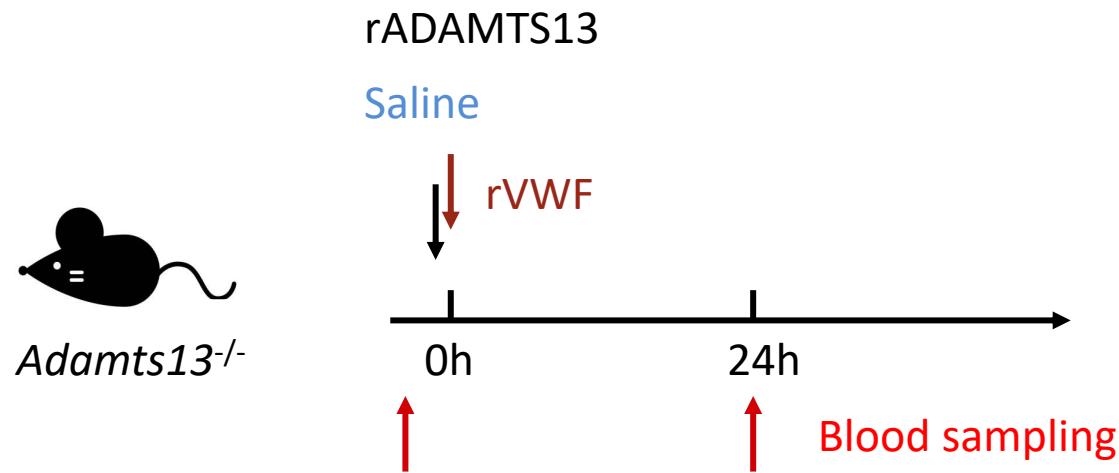

- As treatment for congenital TTP

# Novel therapies for TTP

- Recombinant ADAMTS13
- As treatment for congenital TTP
  - Prophylactic

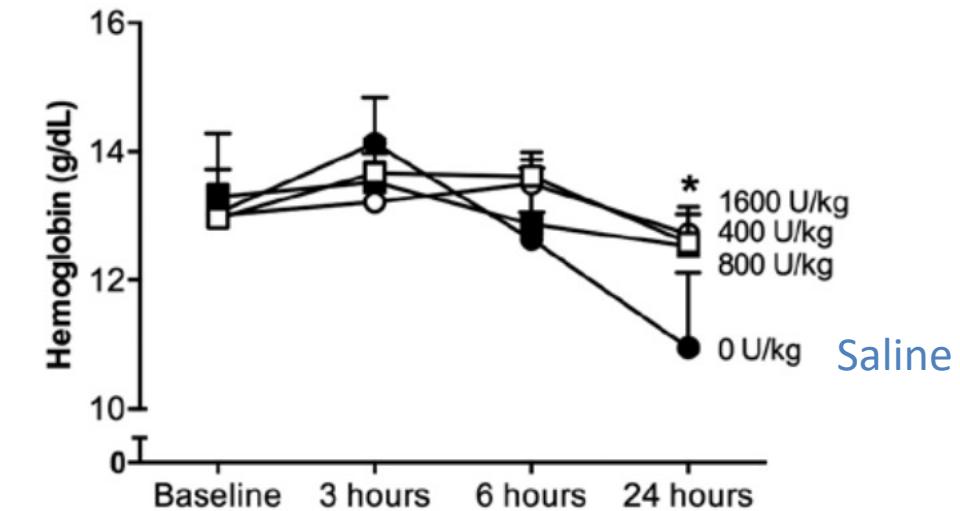

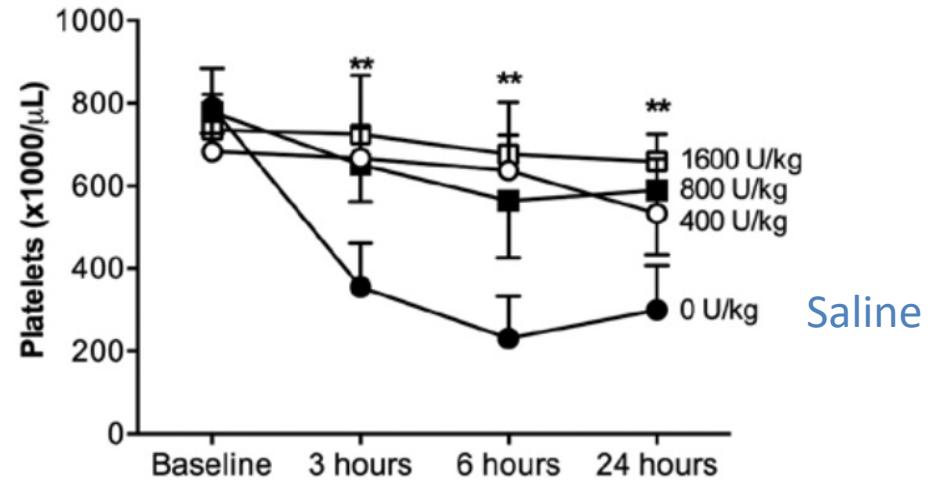

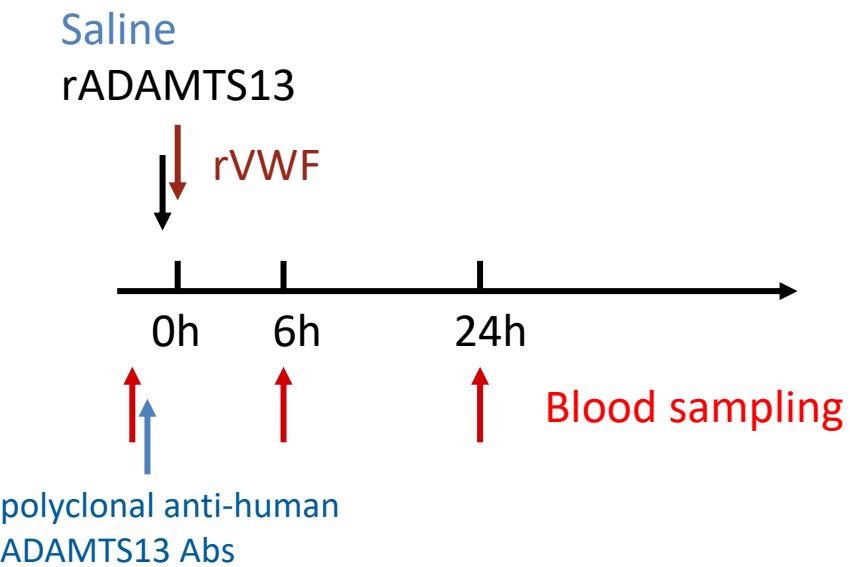

# Novel therapies for TTP

- Recombinant ADAMTS13
- As treatment for immune-mediated TTP
  - Prophylactic
  - Prevents: thrombocytopenia, hemolytic anemia, increase in LDH

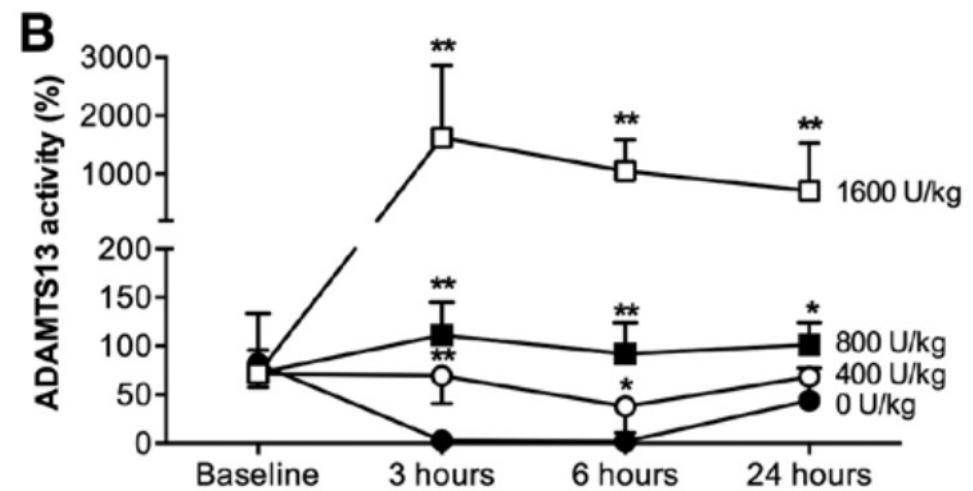

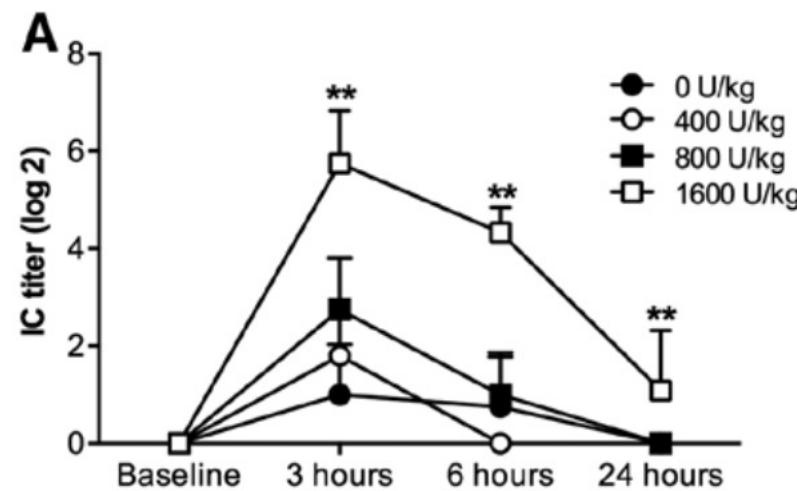

Rat injected with polyclonal anti-human ADAMTS13 Abs:  
ADAMTS13 deficient

# Novel therapies for TTP

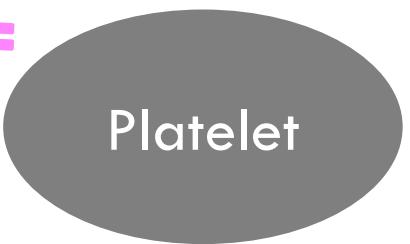

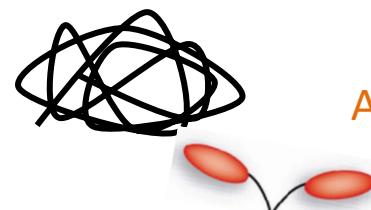

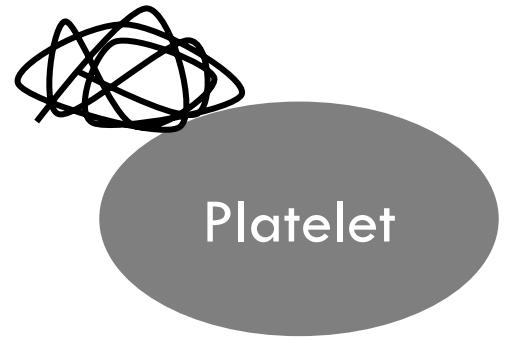

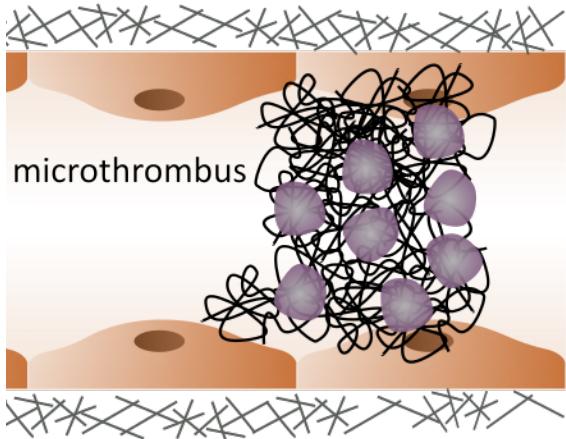

- Recombinant ADAMTS13
- As treatment for immune-mediated TTP
  - Overrides inhibitory/clearing autoantibodies, restores ADAMTS13 activity: immune complexes are formed

# Novel therapies for TTP

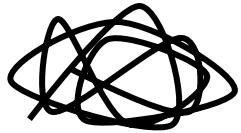

- Inhibiting microthrombi formation

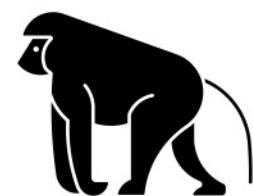

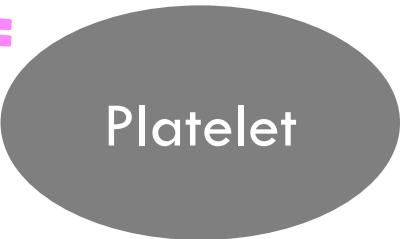

# Novel therapies for TTP

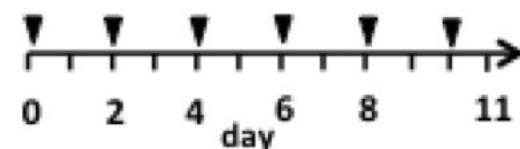

- Inhibiting microthrombi formation
- As treatment for immune-mediated TTP
  - Prophylactic

## Conclusion

- rADAMTS13
  - Effective to treat congenital and immune mediated TTP in mice and rat TTP models
  - Clinical trials for cTTP and iTTP

## Conclusion

- Anti-VWF and anti-GPIb antibodies to inhibit microthrombi formation
  - Effective to treat immune mediated TTP in baboon TTP model
  - Caplacizumab on the market

- 1. Animal models of TTP represent main characteristics of human disease**
- 2. Animal models of TTP aid in understanding the pathophysiology of TTP**
- 3. Animal models of TTP are valuable in drug discovery**
